

Specimen Creek

Date

Sun, 02/21/2021 - 17:48

Toured in S and E facing terrain in Specimen today. Average HS 100cm, lower 40 is FC and DH to 5mm. Observed 2 natural avalanches, both on the basal persistent layer I would guess. one maybe a week old, partially filled in (SS-N-D1R2-O), and one that ran in the last 24 hrs (SS-N-D1.5R2-O) on a SE aspect, 35 deg at 8200 ft. I thought it was interesting given the lack of new snow and seeming lack of strong winds in this area. 2/5 ECTs had propagation, we had two large collapses.

Observer Name

Sam H
